

5 to 6 Watt HW Dual Series DC/DC Converters

Features

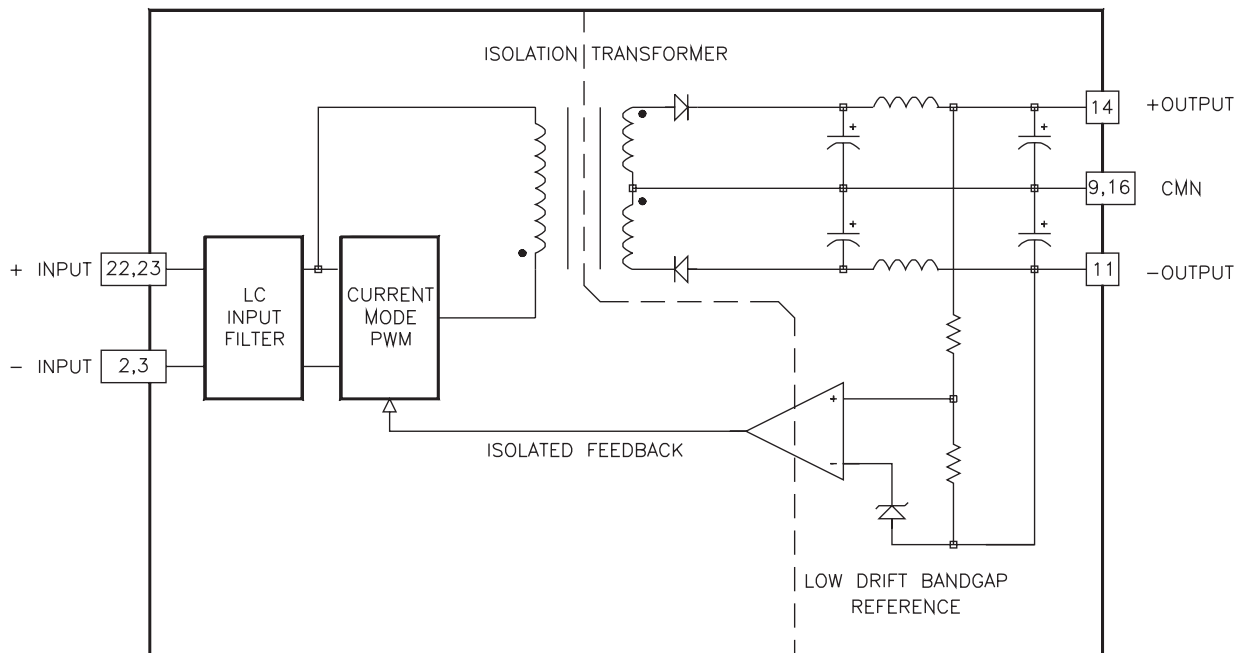

- 4:1 Input Voltage Range
- Internal Input Filter
- Industry Standard Pinout
- Isolation Voltage to 1544 VDC
- Water Washable Case Design

Description

These 5 Watt DC/DC Converters were designed for fast integration with your systems power needs. The 5 Watt HW Duals are ideal for battery operated industrial, medical control and remote data collection systems.

NOTES:

- All parameters measured at Tc=25°C, nominal input voltage and full rated load unless otherwise noted. Refer to the CALEX Application Notes for the definition of terms.
- Output Noise is measured with a 1µF tantalum capacitor and a 0.01µF ceramic capacitor across the output. The fundamental component of noise is at the switching frequency and also is commonly referred to as ripple.
- External fusing should be used for system protection due to a catastrophic failure. See CALEX Application Note 9 in the Calex DC/DC Catalog to determine correct fuse.
- Temperature coefficient is defined for case temperatures. Output voltage deviation is calculated as the maximum resulting from either 1) 25°C case to maximum operating case temperature, or 2) 25°C case to minimum operating case temperature.
- Below the minimum rated load, the output may exhibit noise performance degradation. Operation with less than minimum rated load will not damage the unit, and the DC regulation is not significantly affected.
- The case thermal impedance is specified and the case temperature rise over ambient per package watt dissipated.
- Specifications subject to change without notice.
- Water Washability - Calex DC/DC converters are designed to withstand most solder/wash processes. Careful attention should be used when assessing the applicability in your specific manufacturing process. Converters are not hermetically sealed.
- External Input Capacitance:
The HW Dual Series requires an external input capacitor for proper operation. Operation of this converter without an external input capacitor may cause damage to the converter. A capacitor equivalent to, or larger than a 22µF electrolytic capacitor should be used.
- External Output Capacitance:**
The maximum external output capacitance per output is 200µF.
